KLE GH BCA COLLEGE Haveri

Aishwarya H Valikar

Roll No :01

Division:'A' Section

Semester: First semester

Subject: Fundamentals of Computer and C-program

Q NO 1

1] a] Computer?

Computer is an electronic device that is used for information proccessing it accepts data & instruction stores it in a memory proccess & gives the results to the user

father of computer charles babbage

b] characteristics

High proccessing speed
Accuracy
Reliability
versatability
Deligency

c] capabilities

Huge data storage
Input & output
Processing

c] define pointer & list its types

pointer is prints the output information from the computer on to a papers but know a day pointers are also print graphical information

-> 2 types

1] Impact pointer
2] Non - Impact pointer

DATE: PAGE:

d) Main memory
It's temporary memory
Hald data & instru -ctions till the power supply lasts

secondary memory
* It's permanent memory
* Hald data & instruc -tions as long as the user can do.

e) write the structure of a basic c-program

```
#include<stdio.h>
int main ()
{
printf(" Hello world");
return 0;
}
```

f) Define c-program * who is father of c?
c is high-level language, it is both general purpose and specific purpose in programming language.
* father of c → Dennis Ritchie.

Q. NO II

a) Analog computer: operates on continuous values of data. they give only approximate results & it processed in slow & they have very limited use. they have small memory & less reliable.

b) Digital computer: operates the discrete values of data & they give accurate results It processed in fast they have large memory & more reliable.

③ Hybrid computer: It combination of both analog & digital computers. They accept both the analog & digital data for processing It measuring feature of analog computer & It counting feature of digital computer

③ Explain Generation of computer?

1st Generation: 1946-1956 build or used with vacume tubes the speed 10^{-3} magnetic drums used secondary memory inputs are punch cards & magnetic tips are output

Ex: ENIAC, UNIVAC etc---

2nd Generation: 1957-1964 they used diodes & transister the speed is 10^{-6} they had more member of primary storage it used FORTRAN & PASCAL language.

Ex: IBM-1401, CDC-1604

3rd Generation: 1965-1970 developed (IC) integrated circuit is being used to develop device 10-100 transister are used single chipe. Speed is 10^{-9}

Ex: IBM-360, CDC-6600

4th Generation: 1970-1990 they used (LSI) large scale integration to develop this computer 100-1000 number of transister are used very large scale integration speed is 10^{-9} to 10^{-12}

Ex: IBM-3033 HD-3000

DATE: PAGE:

5th Generation: [51.51] Super large scale integration device used this computer. millions of transister is used to develop this computer

Ex :- CRAY, PARAM.

4] Explain Exchange values

```
#include<stdio.h>
int main()
{
int a, b, temp;
scanf("%d", &a);
scanf("%d", &b);
printf("%d, %d", &a, &b);
temp = a;
a = b;
b = temp;
printf("%d, %d", &a, &b);
return a;
}
```

Write a c- program to calculate addition 2 no

5

```
#include<stdio.h>
int main()
{
int a, b, c;
int a;
int b;
int c;
scanf("%d", &a);
scanf("%d", &b);
scanf("%d", &c);
c = a+b;
Printf("addition of 2no is%d", c);
return 0;
}
```

⑥

① 1st Computer started 2500 B.C name is abacus at china

② 2nd computer jhon nepeir was inventer of the computer invented in 1614

③ 3rd computer is slide nele invented by willion outrate in 1630 he was englieh mathematician.

④ 4th pascline is the name of computer inven-ted in 1642. inventer was blise pascal. It capable for addition, subtraction, multiplica-tion, division etc---

⑤ jacquards loom name of the computer it was invented in 1802 the inventer was joseph marry jacquared he was french manufacturing textile, industry.

⑥ Differencal Engin it was invented in 1882 inventer is charles babbage profeseer of mathemetics combridge university attomati calculation.

7 Analetical engine it was invented in the year 1833 & it was inventer was charles babbage father of computer.

⑧ Mark-I :- It was invented in 1943 & inven-ter is Howard Aitin it was electro machanical computer It could performs sequence arthmatic calculation.

DATE: PAGE:

Input Device: This is used to feed data & instructions into the computer it is connected to the system unit. There are several types of input devices used for inputting data. The keyboard is the most commonly used input device other input devices are mouse, lightpen, joystick, touch panel, disks digital cameras & voice input

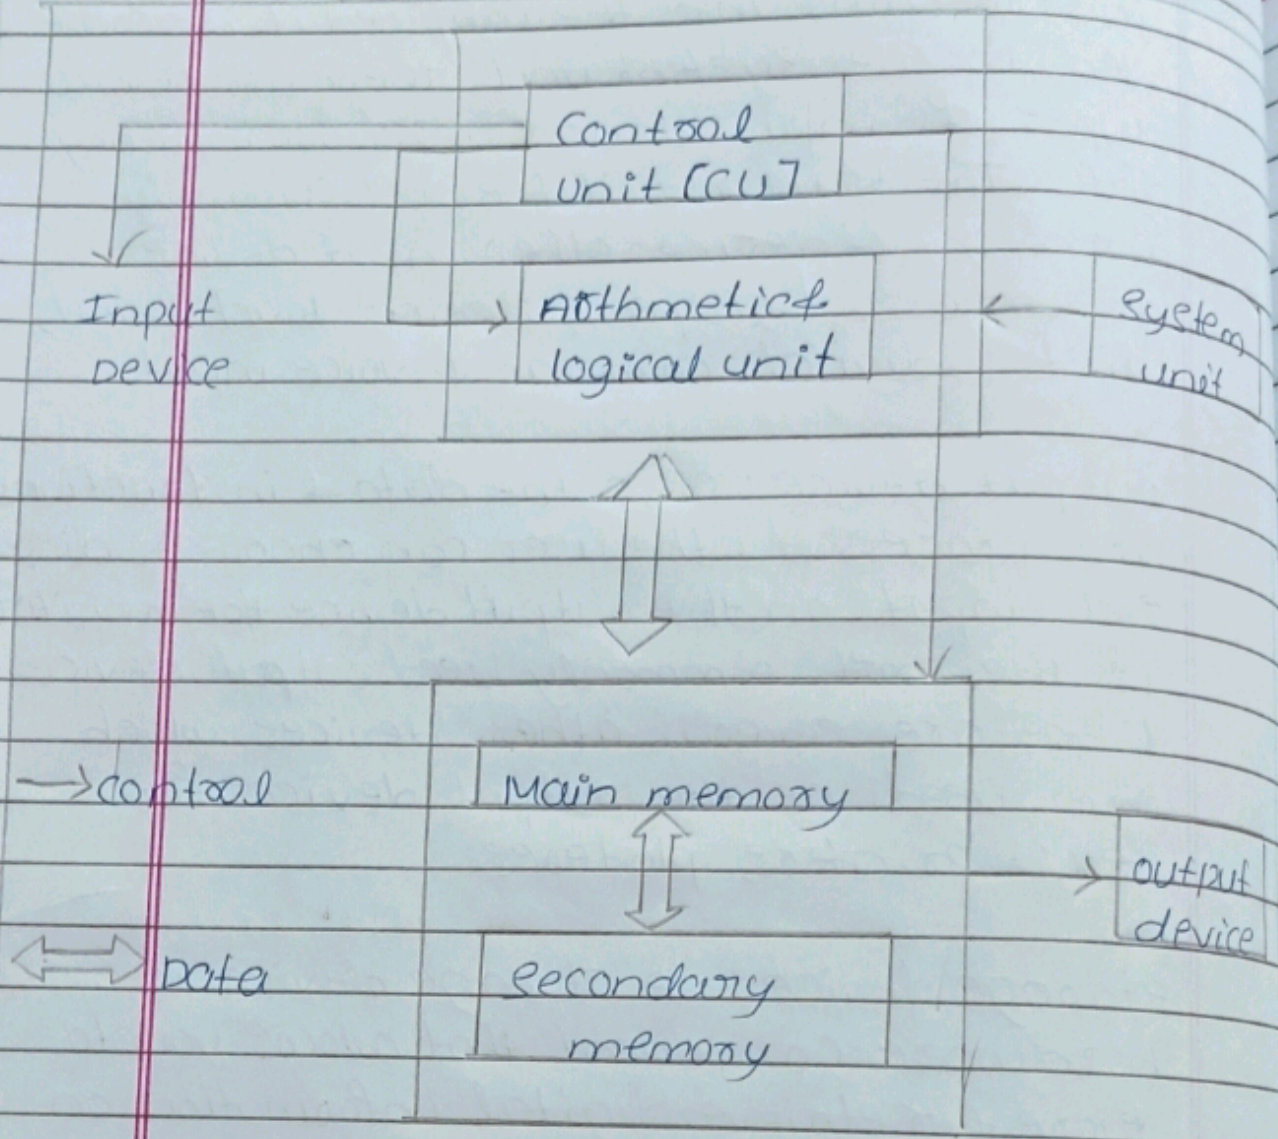

output device: Once the data & instructions are processed. the user can choose to display such input on the output device the monitor is the most commonly used output device. there are several other devices which are used as the output devices for ex:- printers, plotters.

storage device:- A storage device is a hardware component that allows you to store & retrieve digital information on your computer. It provides a means to store data, such as documents photos, videos & software for later use.

⑧ Block Diagram

Basic structure of a computer

① Accepting data & instructions from the user. An input device is used to accept data & instructions.

② Storing data & information in its memory. The memory devices are used to store the data & instructions in the computer.

③ Processing the data & information. the central processing unit [CPU] processes the data.

displaying the process data, finally the monitor or computer screen will display the desired results.

Input device: feed data & instructions into the computer the keyboard is the most commonly used input device other divice are mouse. lightpen joystick. touch panel, microphone, disks.

System unit: This is responsible for storing & processing of data & instructions the CPU is the main unit is a computer system which performs all arithmetic & logical operations.

memory device:- This is used to store the data & instructions feed by the user. The computer memory is measured in terms of bits. bytes & words

out put device: The monitor is the most Comm -ly used output device. There are several other devices which are used as the output devices ex:- printer plotter.
